       /note-"Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung mbHL19W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and so circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driv was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (bases 1 to 443)
/note="Organ: pooled; Vector: pT/T3D-Pac (pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP). Ittp://www.edgp.ebi.ac.uk. - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AARAAWWAWW

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton oroject grant. The DNA was prepared from embryos by Alain Bucheton

                                                                                                                                                                                                                                                                Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The Bogb is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 around constructed by partial EcoRI digestion of Drosophila and provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's pland EST libraries. A more detailed description of the library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DATTDKDTT---KTWTTDDDDWDKAKRDRWWAAKADGAWKWRDRARDDWAATAKDDDGWK

Number of hits that pass the threshold

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

The Chipmention relates to new purified peptides comprising 380 or 427 amino acid sequences, which are receptors for interleukin-13 (II-13); the 380 and 427 am froteins are designated II-13R beta and alpha respectively. The II-13R beta has high affinity for II-13R while II-13R alpha has low affinity, but acquires high affinity when associated with the II-4 receptor Nucleic acids encoding II-13R beta and alpha are used as conditionable or designated with the II-4 receptor Nucleic acids encoding II-13R beta and alpha are used as such as lows of hebarozygos by aberrant synthesis or genetic anomalies such as lows of hebarozygos by aberrant synthesis or chromosomal canomalies. They are also used for production of recombinant II-13R beta and alpha which can be used as II-13 antagonists, specifically to regulate II-13 receptors are also useful as antisense molecules for gene tharpy blocking synthesis of II-13R). Antibodies are used (in standard inmunoassys) to diagnose diseases associated with abnormal expression

                                                                                                               DNA encoding animal haemopoietin receptor which interacts with interleukin-13 - useful to treat asthma, allergy or condition exacerbated by IgE production

Claim 5; Page 52-54; 93pp; English.

Novel mouse and human haemoprotein receptors (W09821 and W09822),

designated NR4, comprise the interleukin-13 (IL-13) receptor

alpha-chain. The human NR4 amino acid sequence was deduced from a composite DNA sequence (T66165) derived from bone marrow cDNA clones. Recombinant NR4, or fusion proteins including NR4, can be produced in transformed host cells. The receptor molecules and their components are useful in the development of a range of
                   agonists, antagonists, therapeutics and diagnostic reagents based on ligand interaction with its receptor, esp. for the development of cpds. capable of modulating the activity of IL-13 and related cytokines such as interleukin-4 for the treatment of allergy, asthma
                                                                                                                                                                                                                                                                                                                                                                                           N-PSDB; T66165.

            The inventors claim: an isolated cDNA sequence encoding murine (secretory) interleukin-5 (II-5) receptor, which is synthesised from murine early B cell mRNA; an isolated murine (secretory) II-5 receptor; an isolated cDNA sequence encoding human (secretory) II-5 receptor, which is synthesised from mRNA of human peripheral blood eosinophil; and an isolated human (secretory) II-5 receptor. Also claimed are a COS monkey cell transfected with a recombinant vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                receptor; an isolated cDNA sequence encoding human (secretory) II-5 receptor, which is synthesised from mRNA of human peripheral blood eosinophil; and an isolated human (secretory) II-5 receptor. Also claimed are a COS monkey cell transfected with a recombinant vector contg. the DNA; secretory human II-5 lacking a cytoplasmic and a transmembrane region; and an expression vector.

                                                                                               Claim 8; Page 24-25; 65pp; English.

The inventors claim: an isolated cDNA sequence encoding murine (secretory) interleukin-5 (II-5) receptor, which is synthesised from murine early B cell mRNA; an isolated murine (secretory) II-5 receptor; an isolated cDNA sequence encoding human (secretory) II-5 receptor, which is synthesised from mRNA of human peripheral blood eosinophil; and an isolated human (secretory) II-5 receptor. Also claimed are a COS monkey cell transfected with a recombinant vector contg. the DNA; secretory human II-5 lacking a cytoplasmic and a

which shares nomology with cytonine acception. The resulting polypeptide testis tissue obtained from a Celebus macaque. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands promoting proliferation spermatogenesis. It can be used to detect ligands promoting proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             30-MAR-1998 (first entry)
Celebus macaque Zcytor2 protein.
Cytokine receptor; ligand binding; testicular cell; spermatogenesis;
Infertility; antagonist; contraceptive; diagnostic; therapeutic.
                                                                                                      and/or differentiation of such cells in cultures and may also be used treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid encoding testis-specific cytokine receptor for identification of ligands or antagonists, potentially for male contraceptives or for infertility treatment
                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and is isolated from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      OHara PJ;

                                                                                                                                                                                                                                                encoding it, for treatment of interleukin-5 mediated disorders such as chronic asthma claim 7; Fig 1; 15pp; English.

This amino acid sequence was deduced from the nucleotide sequence, isoluted as detailed in Q25790. The cytoplasmic domain is 58 mmino acid sequence in signal transduction processes cun not be found in this short cytoplasmic tail. Recombinant IL-5 alpha chain can be used as an IL-5 antagonist in chronic asthma or other disease states with demonstrated esosinophilia. It may also be used either alone or with the beta chain of the whole IL-5 receptor as a tool for screening for IL-5 antagonists. See also Q25790-2,R25063.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TTTTTTTTTTCXXXCTC
Claim 11; Pages 34-35; 49pp; English.

The present sequence represents the human interleukin-13 (II-13) binding chain of the interleukin-13 receptor, designated II-13bc. II-13bc acts a mediator of the known biological activities of II-13. Recombinant II-13bc proteins, and antibodies raised against them, are used to inhibit the binding of II-13 to its receptor. They are particularly used to treat IgE-mediated conditions, e.g. allergy, asthma and immune complex to treat IgE-mediated conditions, e.g. allergy, asthma and Grave's disease. They are also used to treat immune deficiency (particularly in hematopoietic progenitor cells), cancer etc., and to increase macrophage activation, e.g. in vaccination. To potentiate II-13 activity, a protein with such activity is combined with II-13bc and the mixture applied, in vivo, to a cell expressing at least one chain of the II-13 receptor other than II-13bc. II-13bc can also be used in diagnosis to detect expression of II-13, its receptor or binding chain, and to raise specific antibodies which may be useful for treating some tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           W35295;

                                          New nucleic acid encoding testis-specific cytokine receptor - useful for identification of ligands or antagonists, potentially for use as male contraceptives or for infertility treatment claim 2; Page 47-48; 79pp; English.

This sequence represents a novel ligand-binding receptor, 2cytor2, which shares homology with cytokine receptors and was isolated from placental polyA+ RNA. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surf of testicular cells, probably being involved in spermatogenesis. It

By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used tassay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor,
                                                                                                                                                                                                                                                                                                                         Human cytokine/peptide receptor, HR-1 receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This protein comprises a novel human cytokine/peptide hormone creceptor, designated HR-1 receptor. The amino acid sequence was dediced ifrom a cDNA clone (see V04075) isolated from a human contestis cDNA ilbrary. It shows 27% amino acid identity and 52% similarity with the human interleukin-5 receptor. Also claimed are polypuclectides encoding HR-1 receptor, vector and host cells, an agonist to the polypeptide, antibody against the polypeptide, and contesting a disease, or a susceptibility to disease, related to expression of HR-1 receptor, and a method for identifying compounds that activate or inhibit the HR-1 receptor. HR-1 receptor protein and polynucleotides can be used for research, biological, diagnosis and (gene) therapy applications, e.g. to increase resistance to infections in individuals with trauma and/or burns, and to prevent, ameliorate, treat, diagnose and/or determine predisposition to asthma, allergic disorders or disorders of cyclic neutropaenia or as a consequence of cytotoxic therapy of cancer, 19mphoma, leukaemia and/or bone marrow transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

Claim 15; Fig 1; 75pp; English.
CC The sequence is that of the human cytokine/peptide hormone receptor
CC (HR-1 receptor). This, or it's activators or agonists, can be used to
CT treat, prevent or diagnose predisposition to lowered resistance to
CT infection, asthma, allergic or haematopoletic disorders, e.g. where
CT induced by acquired immune defliciency syndrome (AIDS), aplastic anaemia,
CT receptor, e.g. antibodies or fragments of it may be used to treat
CT conditions associated with overexpression of the HR-1 receptor, e.g.
CT those listed above. Antibodies may also be used to assay levels of HR-1
CT receptor, overexpression of which may be diagnostic of tumours, by usual
CT infuncoassays; to isolate and identify HR-1 receptor-expressing cells; or

CC The II-13R beta has high affinity for III-13R beta and alpha has low CC affinity, but acquires high affinity when associated with the II-4 CC diagnostic probes to identify aberrant synthesis or genetic anomalies such as loss of heterozygosity and rearrangements, or chromosomal CC anomalies. They are also used for production of recombinant II-13R beta and alpha which can be used as II-13 antagonists, specifically to CC allergy. II-13 receptors are also useful as antisense molecules for gene CC allergy in the sign of II-13R). Antibodies are used (in standard CC immunoassays) to diagnose diseases associated with abnormal expression overproduction of II-13R coupled to a toxin also for treatment of used to identify ligands and modulators of II-13R. Note: II-13R beta CC used to identify ligands and modulators of II-13R. Note: II-13R beta CC specification (T86464), which is not the same as that shown in the CC sequence listing (T85828).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

PR Nucleic acid sequence encoding human cytokine peptide hormone receptor useful to treat, prevent or diagnose, e.g. lowered pr resistance to infection, asthma, allergy or haematopoietic disease Claim 13; Page 62-64; 76pp; English.

CC This protein comprises a novel human cytokine/peptide hormone receptor, designated the HR-1 receptor, that shows 27% identity and 25% similarity to the interleukin-5 receptor. Its amino acid sequence was deduced from a cDNA clone (see V04131) obtained from a Chaimed host cells, and used in a claimed method for identifying CC compounds which bind to, and activate or inhibit, it. HR-1 receptor activators and agonists can be used to treat, prevent or caplastic anaemia, neutropaenia or cytotoxic treatments for cancer. CC dragnose predisposition to lowered resistance to infection, asthma, callergic or haematopoietic disorders, e.g. where induced by AIDS, can antagonists, e.g. antibodies or HR-1 receptor fragments, can coverexpression. The antibodies can also be used to determine HR-1 covered resistance to infection, asthma, cc sequence 380 AA;
